# Name: SANDEEP KUMAR THAKUR <u>Email id</u>: sandeepkrthakur3@gmail.com

# **Task 3:** Operation Analytics and Investigating Metric Spike

# Analysis done on the following points:-

# Case Study 1: Job Data

- A. Number of jobs reviewed: Amount of jobs reviewed over time.
  Your task: Calculate the number of jobs reviewed per hour per day for November 2020?
- **B.** Throughput: It is the no. of events happening per second.

  Your task: Let's say the above metric is called throughput. Calculate 7 day rolling average of throughput? For throughput, do you prefer daily metric or 7-day rolling and why?
- C. Percentage share of each language: Share of each language for different contents. Your task: Calculate the percentage share of each language in the last 30 days?
- **D. Duplicate rows:** Rows that have the same value present in them. **Your task:** Let's say you see some duplicate rows in the data. How will you display duplicates from the table?

# **Software used:** MySQL Workbench 8.0 CE

# **Case Study 2: Investigating metric spike**

**A.** User Engagement: To measure the activeness of a user. Measuring if the user finds quality in a product/service.

Your task: Calculate the weekly user engagement?

B. User Growth: Amount of users growing over time for a product. Your task: Calculate the user growth for product?

C. Weekly Retention: Users getting retained weekly after signing-up for a product. Your task: Calculate the weekly retention of users-sign up cohort?

**D. Weekly Engagement:** To measure the activeness of a user. Measuring if the user

finds quality in a product/service weekly.

Your task: Calculate the weekly engagement per device?

E. Email Engagement: Users engaging with the email service. Your task: Calculate the email engagement metrics?

**Number of jobs reviewed:** Amount of jobs reviewed over time. Calculate the number of jobs reviewed per hour per day for November 2020?

To find the number of jobs reviewed per hour per day of November 2020:

- 1. We will use the data from **job\_id** columns of the job\_data table.
- 2. Then we will divide the total count of job\_id (distinct and non-distinct) by (30 days \* 24 hours) for finding the number of jobs reviewed per day

Program/Query (non\_distinct\_job\_id):

select count(job\_id)/(30\*24) as number\_of\_jobs\_reviewed\_per\_day\_non\_distinct from job\_data;

Output / Result

number of jobs reviewed per day non distinct 0.0111

Number of jobs reviewed: Amount of jobs reviewed over time.

Calculate the number of jobs reviewed per hour per day for November 2020?

```
Program/Query (distinct_job_id):

select
count(distinct job_id)/(30*24) as
number_of_jobs_reviewed_per_day_distinct from job_data;
```

**Output / Result** 

# Throughput: It is the no. of events happening per second.

Let's say the above metric is called throughput. Calculate 7 day rolling average of throughput? For throughput, do you prefer daily metric or 7-day rolling and why?

For calculating the throughput we will be using the 7-day rolling because 7-day rolling gives us the average for all the days right from day 1 to day 7 Whereas daily metric gives us average for only that particular day itself.

For calculating the 7-day rolling daily metric average of throughput:-

- We will be first taking the count of job\_id(distinct and non-distinct) and ordering them w.r.t ds (date of interview)
- 2. Then by using the ROW function we will be considering the rows between 6 preceding rows and the current row
- 3. Then we will be taking the average of the jobs\_reviewed

# **Throughput:** It is the no. of events happening per

second.

Let's say the above metric is called throughput. Calculate 7 day rolling average of throughput? For throughput, do you prefer daily metric or 7-day rolling and why?

```
Program/Query (distinct_job_id):

SELECT ds as date_of_review, jobs_reviewed, AVG(jobs_reviewed)

OVER(ORDER BY ds ROWS BETWEEN 6 PRECEDING AND CURRENT

ROW) AS

throughput_7_rolling_avera
ge FROM
(

SELECT ds, COUNT( DISTINCT job_id) AS
jobs_reviewed FROM job_data

GROUP BY ds ORDER BY ds
) a;
```

#### **Output / Result**

date_of_review	jobs_reviewed	throughput_7_rolling_average
25-11-2020	1	1
26-11-2020	1	1
27-11-2020	1	1
28-11-2020	2	1.25
29-11-2020	1	1.2
30-11-2020	2	1.3333

# **Throughput:** It is the no. of events happening per

second.

Let's say the above metric is called throughput. Calculate 7 day rolling average of throughput? For throughput, do you prefer daily metric or 7-day rolling and why?

```
Program/Query (non_distinct_job_id):

SELECT ds as date_of_review, jobs_reviewed, AVG(jobs_reviewed)

OVER(ORDER BY ds ROWS BETWEEN 6 PRECEDING AND CURRENT

ROW) AS

throughput_7_rolling_average_non_distinct_jo

b_id FROM

(

SELECT ds, COUNT(job_id) AS

jobs_reviewed FROM job_data

GROUP BY ds ORDER BY ds
) a;
```

### **Output / Result**

date_of_review	jobs_reviewed	throughput_7_rolling_average_non_distinct_job_id
25-11-2020	1	1
26-11-2020	1	1
27-11-2020	1	1
28-11-2020	2	1.25
29-11-2020	1	1.2
30-11-2020	2	1.3333

<u>Percentage share of each language:</u> Share of each language for different context

#### Calculate the percentage share of each language?

To calculate the percentage share of each language (distinct and non-distinct):-

- 1. We will first divide the total number of languages (distinct/non-distinct) by the total number of rows presents in the table
- 2. Then we will do the grouping based on the languages.

```
Program/Query (non_distinct_language):

select

job_data.job_id, job_data.language,
    count(job_data.language) as
    total_of_each_language,
    ((count(job_data.language)/(select count(*) from job_data))*100) as
    percentage_share_of_each_language

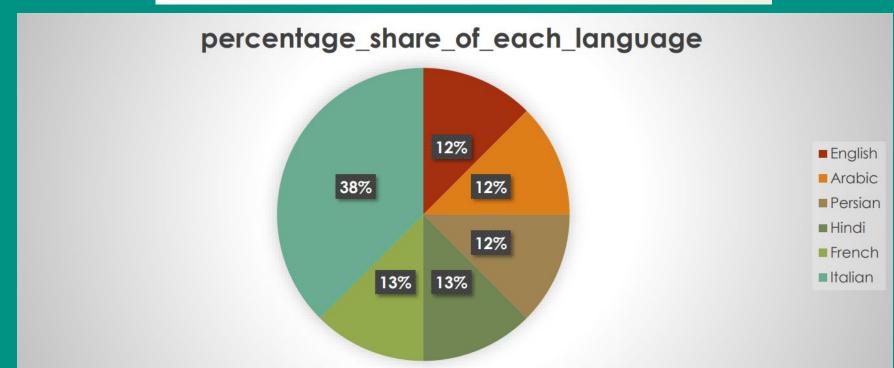

from job_data
    group by job_data.language;
```

<u>Percentage share of each language:</u> Share of each language for different contents.

Calculate the percentage share of each language?

# **Output / Result**

job_id	language	total_of_each_language	percentage_share_of_each_language
21	English	1	12.5
22	Arabic	1	12.5
23	Persian	3	37.5
25	Hindi	1	12.5
11	French	1	12.5
20	Italian	1	12.5

<u>Percentage share of each language:</u> Share of each language for different contents.

Calculate the percentage share of each language?

```
Program/Query (distinct_language):

select

job_data.job_id, job_data.language,
    count(distinct job_data.language) as total_of_each_language,
    ((count(job_data.language)/(select count(*) from
    job_data))*100) as
    percentage_share_of_each_distinct_language

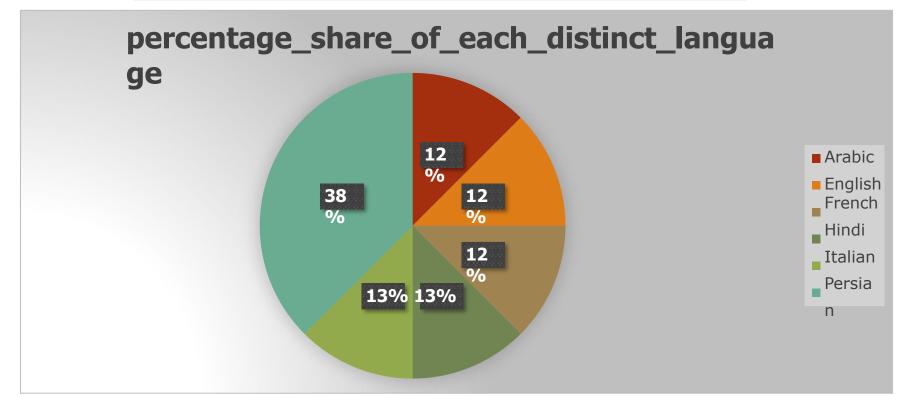

from job_data
    group by job_data.language;
```

# <u>Percentage share of each language:</u> Share of each language for different contents.

Calculate the percentage share of each language?

Output / Result

job_id	language	total_of_each_language	percentage_share_of_each_distinct_language
22	Arabic	1	12.5
21	English	1	12.5
11	French	1	12.5
25	Hindi	1	12.5
20	Italian	1	12.5
23	Persian	1	37.5

<u>Duplicate rows:</u> Rows that have the same value present in them.

Let's say you see some duplicate rows in the data. How will you display duplicates

from the table?

To view the duplicate rows having the same value we will:-

- 1. First decide in which do we need to find the duplicate row values
- 2. After deciding the column(parameter) we will use the ROW\_NUMBER function to find the row numbers having the same value
- 3. Then we will portioning the ROW\_NUMBER function over the column (parameter) that we decided i.e. job\_id
- 4. Then using the WHERE function we will find the row\_num having value greater than 1 i.e. row\_num > 1 based on the occurrence of the job\_id in the table.

**Duplicate rows:** Rows that have the same value present in them.

Let's say you see some duplicate rows in the data. How will you display duplicates from the table?

```
Program/Query:

SELECT *
FROM
(
SELECT *, ROW_NUMBER()OVER(PARTITION BY job_id) AS row_num
FROM job_data
) a
WHERE row_num>1;
```

# **Output/Result**

ds	job_id	actor_id	event	language	time_spent	org	row_num
28-11-2020	23	1005	transfer	Persian	22	D	2
26-11-2020	23	1004	skip	Persian	56	А	3

<u>User Engagement:</u>

To measure the activeness of a user. Measuring if the user finds quality in a product/service.

Your task: Calculate the weekly user engagement?

To find the weekly user engagement:-

- 1. We will extract the week from the occurred\_at column of the events table using the **EXTRACT** function and **WEEK** function
- 2. Then we will be counting the number of distinct user\_id from the events table
- 3. Then we will use the **GROUP BY** function to group the output w.r.t **week from occurred\_at**

```
Program/Query:

SELECT
extract (week from occurred_at) as
week_number, count(distinct user_id) as
number_of_users
FROM
tutorial.yammer_events
group by
week_number;
```

**User Engagement:** To measure the activeness of a user. Measuring if the user finds quality in a product/service.

Your task: Calculate the weekly user engagement?

# **Output Result**

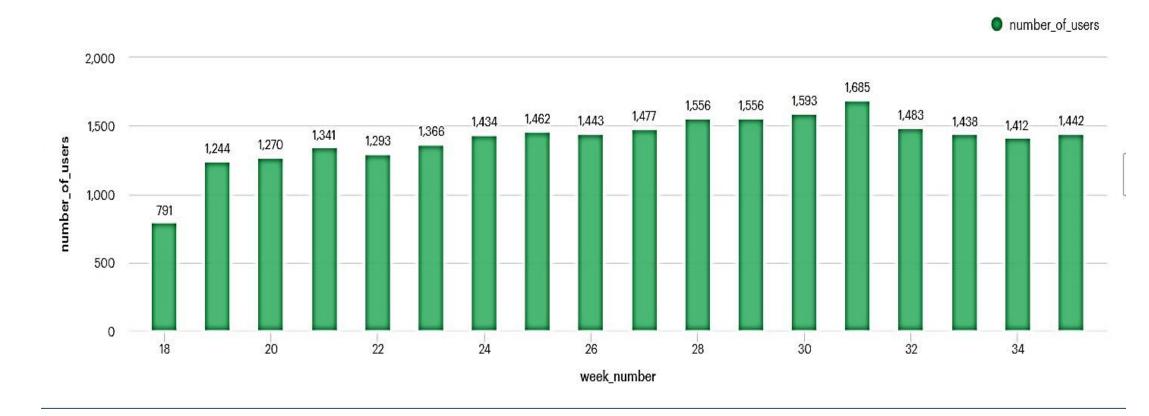

week_number	number_of_users
18	791
19	1244
20	1270
21	1341
22	1293
23	1366
24	1434
25	1462
26	1443
27	1477
28	1556
29	1556
30	1593
31	1685
32	1483
33	1438
34	1412
35	1442

**User Engagement:** To measure the activeness of a user. Measuring if the user finds quality in a product/service.

Your task: Calculate the weekly user engagement?

# **Output / Result**

Weekly user\_engagement

**User Growth:** Amount of users growing over time for a product.

Your task: Calculate the user growth for product? User Growth = Number of active users per week

To find the user growth (number of active users per week):-

- First we will the extract the year and week for the occurred\_at column of the
  - users table using the extract, year and week functions
- Then we will group the extracted week and year on the basis of year and week number
- 3. Then we ordered the result on the basis of year and week number
- Then we will find the cumm\_active\_users using the SUM, OVER and ROW function between unbounded preceding and current row

<u>User Growth:</u> Amount of users growing over time for a product.
Your task: Calculate the user growth for product?
User Growth = Number of active users per week

# Program/Query:

```
select year_num,
week_num,
 num active users,
 SUM(num_active_users)OVER(ORDER BY year_num, week_num ROWS BETWEEN
UNBOUNDED PRECEDING AND CURRENT ROW) AS cum active users
from
select
 extract (year from a.activated_at) as year_num,
 extract (week from a.activated_at) as week_num,
 count(distinct user_id) as num_active_users
from tutorial.yammer users a
WHERE
 state = 'active'
group by year_num,week_num
order by year_num,week_num
) a;
```

# <u>User Growth</u>: Amount of users growing over time for a product. Your task: Calculate the user growth for product? User Growth = Number of active users per week

Output / Result

year_num	week_num	num_active_users	cum_active_users	year_num	week_num	num_active_users	cum_active_users
2013	1	L 67	67	2013	45	97	256

**<u>User Growth</u>**: Amount of users growing over time for a product.

Your task: Calculate the user growth for product? User Growth = Number of active users per week

```
Program/Query:
select count(*) from
tutorial.yammer_users where state =
'active';
```

## **Output / Result**

count 9381

Hence, there are in total 9381 active users from 1<sup>st</sup> week of 2013 to the 35<sup>th</sup> week of 2014

# **Weekly Retention:** Users getting retained weekly after signing-up for a product. Your task: Calculate the weekly retention of users-sign up cohort?

The weekly retention of users-sign up cohort can be calculated by two means i.e. either by specifying the week number (18 to 35) or for the entire column of occurred\_at of the events table.

- Firstly we will extract the week from occurred\_at column using the extract, week
  functions
- 2. Then, we will select out those rows in which event\_type = 'signup\_flow' and event\_name = 'complete\_signup'
- 3. If finding for a spectifc week we will spectify the week number using the **extract** function
- 4. Then using the left join we will join the two tables on the basis of user\_id where event\_type = 'engagement'
- 5. Then we will use the **Group By** function to group the output table on the basis of user\_id
- 6. Then we will use the **Order By** function to order the result table on the basis of user id

<u>Weekly Retention</u>: Users getting retained weekly after signing-up for a product. Your task: Calculate the weekly retention of users-sign up cohort?

# **Program/Query(Without Specifying the week**

```
number):
SELECT
distinct user id,
COUNT(user id),
SUM(CASE WHEN retention week = 1 Then 1 Else 0 END) as per week retention

<u>question D weekly user engagement per</u> <u>device.csv - Google Drive</u>

# **Email Engagement:** Users engaging with the email service.

Your task: Calculate the email engagement metrics?

To find the email engagement metrics(rate) of users:-

- We will first categorize the action on the basis of email\_sent, email\_opened and email\_clicked using the CASE, WHEN, THEN functions
- 2. Then we select the sum of category of **email\_opened** divide by the sum of the category of **email\_sent** and multiply the result by 100.0 and name is as **email\_opening\_rate**
- 3. Then we select the sum of category of **email\_clicked** divide by the sum of the category of **email\_sent** and multiply the result by 100.0 and name is as **email\_clicking\_rate**
- 4. email\_sent = ('sent\_weekly\_digest','sent\_reengagement\_email')
- 5. email\_opened = 'email\_open'
- 6. email\_clicked = 'email\_clickthrough'

# **Email Engagement:** Users engaging with the email service. Your task: Calculate the email engagement metrics?

```
Program/Query:
 SELECT
 100.0*SUM(CASE when email_cat = 'email_opened' then 1 else 0 end)/SUM(CASE when
email cat = 'email sent' then 1 else 0 end) as email opening rate,
 100.0*SUM(CASE when email cat = 'email clicked' then 1 else 0 end)/SUM(CASE when
email cat = 'email sent' then 1 else 0 end) as email clicking rate
FROM (
SELECT
 CASE
  WHEN action in ('sent_weekly_digest','sent_reengagement_email')
   then 'email sent'
  WHEN action in ('email_open') then
   'email opened'
  WHEN action in ('email_clickthrough') then
   'email clicked'
 end as email cat
from tutorial.yammer_emails
) a;
```
